Tanking On Stage

Final Postmortem

Presenter - Alex Yu

How "Tanking On Stage" Works

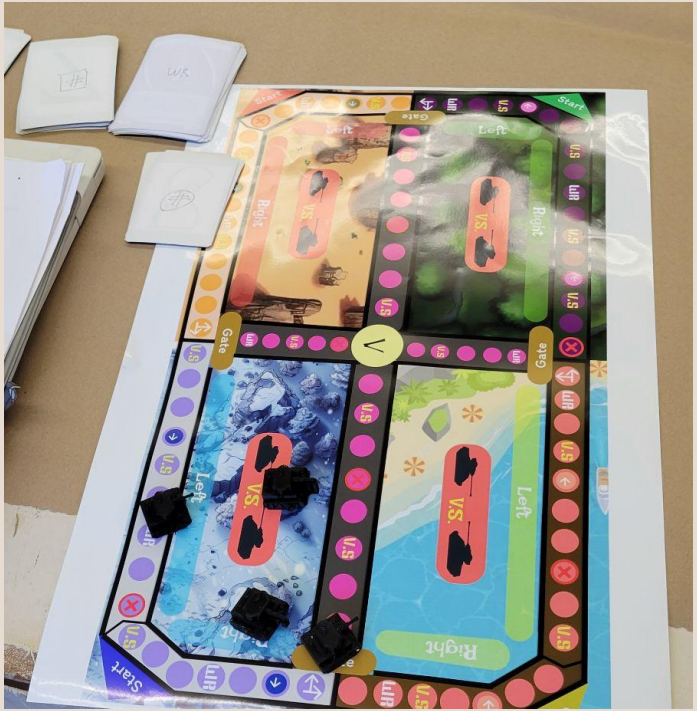
- **Objective**: Be the last player standing by eliminating all four of your opponents' troopers, OR be the first to open a gate with the Key and reach the board center.

- **Movement**: Players draw number cards (1-4) to determine movement, replacing traditional dice rolls.

- **Combat (V.S. Spaces)**: Landing on a V.S. space forces a random duel where tanks fight using number cards to determine initiative.

- **Tactics**: Utilize War Mechanic cards (like Air Strike or CeaseFire) to gain advantages or disadvantages during the game.

- **Lives**: Each player has 4 Troopers; losing a tank uses up one Trooper/life.



Game Design Pillars

Pillar 1: Team Survival & Resource Management

- The objective is to survive the entire game and demolish enemies until their four troopers are deceased.
- The troopers act as multiple "lives" or resource counts.

Pillar 2: Forced, High-Stakes Combat (V.S. System)

- Combat is initiated by landing on a V.S. space and drawing a color card to randomly match an opponent.
- The victor can seize the Key from the loser.

Pillar 3: Tactical Card Influence

- Players use War Mechanic cards to distribute advantageous or disadvantageous effects
- Tactical moments like CeaseFire (retreating) or Air-strike (dealing critical damage)

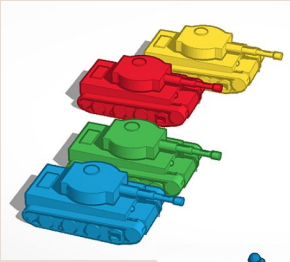
Game Visual Pillars

Pillar 1: War-Themed Focus

- The game utilizes a military/conflict theme: tanks, troopers, Air-strike attacks, and War Mechanic cards.

Pillar 2: Color-Coded Clarity

- The game is highly dependent on four distinct colors (RED, BLUE, YELLOW, GREEN) for player designation, turn order, and combat matching (drawing a color card).



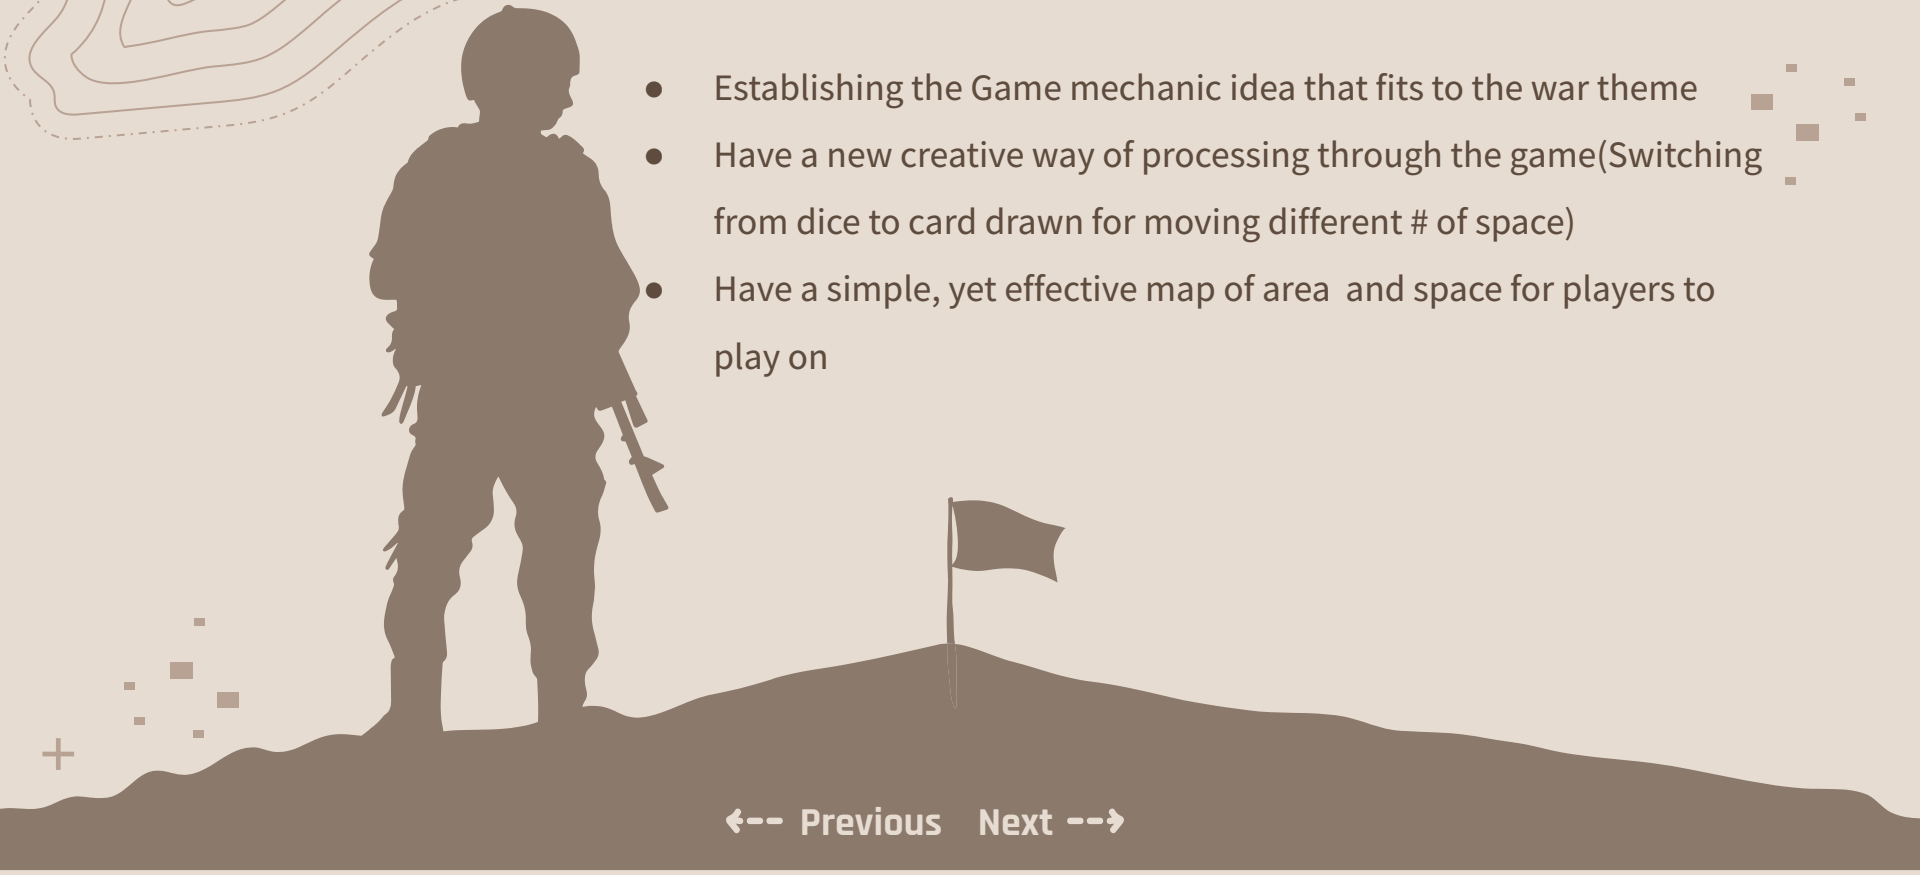
Pillar 3: Landmark/Sectional Board Structure

- The board is defined by four different landmarks on each corner, which are later connected by locked gates leading to the center.
- Using Figma, in creating the board game.

Previous Next

What Went Right during Development?

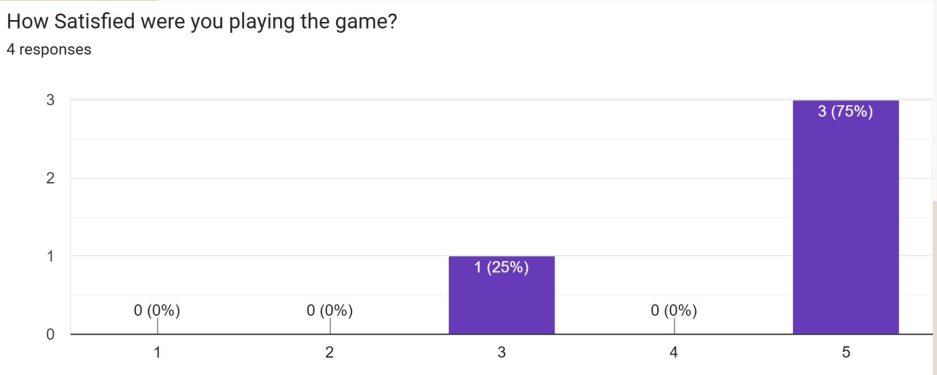
- Establishing the Game mechanic idea that fits to the war theme
- Have a new creative way of processing through the game(Switching from dice to card drawn for moving different # of space)
- Have a simple, yet effective map of area and space for players to play on

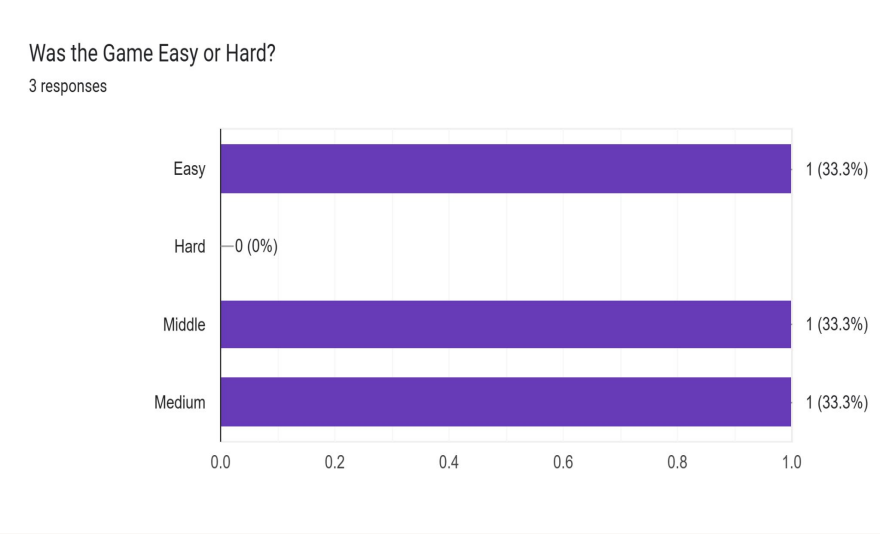


What Went Wrong During Development?

- Had to take revision, ensuring the game process is fair and works well. (Taking a bit of long period of time.)
- Physical board game took another long processing time to make and struggles to understand the new program into making the board game.

Playtesting Feedback Summary





Playtesting Insights

Pros	Cons
• Spaces correspond correctly with the cards • Differenants than a regular game and sort of easy to keep track • Board and layout was not super complicated	• Hard to keep track of the health attacking each other

Future Improvement & Takeaways

- Need a clearer method to track player health during V.S. combat, as it was noted as a pain point in playtesting.
- Consider changing the tank attack damage to better balance combat pacing.
- Introduce a wider range of movement options by adding more number cards for space movements than the current limit of 4.
- Must allocate more time in future projects to master new programs like Figma, which slowed down the physical board game production.
